

8 “Must-Have” Workflow Features for Tanker Truck Fleets

Hauling hazardous materials can be tricky, but with the right workflow features, it can be a whole lot smoother. Whether navigating busy highways or managing complex logistics, having the right tools at your disposal can make all the difference. Check out this checklist to learn what key workflow features you need for tanker truck fleets.

01

Customized Workflow

Forget the one-size-fits-all approach. Your fleet deserves a workflow tailored to its unique needs. When everything's set up just right, capturing data becomes a breeze, and your drivers can stay focused on the road.

02

Dynamic Forms

Generic forms often lead to duplicative data entry or missed insights. Look for forms that adapt to your drivers' needs, cutting out unnecessary questions and ensuring they're always on the right track.

03

Visual Indicators

Keep things crystal clear for your drivers with color-coded fields. No more guessing games about which fuel or product goes where. These handy visual cues minimize errors and keep everything running smoothly.

04

Seamless Integration

Switching between different apps can be a real headache. That's why you need a workflow that brings everything together in one place. With seamless integration, your drivers can enjoy a better user experience and you'll get the right data on the backend.

05

Single Sign-On

Simplify the login process for your drivers with single sign-on. Less time spent on admin tasks means more time doing what they do best – driving.

06

Automated Data Capture

Who has time for redundant data entry? Make life easier for your drivers with software that automatically carries over information from one task to the next. It's all about keeping things flowing smoothly.

07

Real-Time Calculations

Forget manual math and let your workflow software handle real-time fuel calculations without needing pen and paper. You'll receive more accurate results, and your drivers can complete fuel stops more efficiently.

08

Safety Enforcement

Safety always comes first, so your workflow software should help promote the right safety protocols throughout your drivers' day. Ensure your workflows include customizable safety measures, like mandatory DVIR submissions, to keep your drivers and cargo safe on the road.
